Residual resampling in SMC

Suzie Brown

April 5, 2019

The offspring counts are sampled according to:

$$v_t^{(i)} = \lfloor Nw_t^{(i)} \rfloor + X_i$$
$$X_i \sim \text{Multinomial}(N - k, (\bar{w}_t^{(1)}, \ldots, \bar{w}_t^{(N)}))$$

where $k := \sum_{i=1}^N \lfloor Nw_t^{(i)} \rfloor$ is the number of offspring assigned deterministically, and $\bar{w}_t^{(i)} := \frac{Nw_t^{(i)} - \lfloor Nw_t^{(i)} \rfloor}{N-k}$ are the residual weights. Let us also define the residuals $r_i := Nw_t^{(i)} - \lfloor Nw_t^{(i)} \rfloor$.

1 Coalescence rate

We shall calculate the expected coalescence rate in the case of residual resampling. The coalescence rate is defined in **?** as

$$c_N(t) := \frac{1}{(N)_2} \sum_{i=1}^N \mathbb{E}\left[(v_t^{(i)})_2\right].$$

The inner expectation comes out as

$$
\begin{aligned}
\mathbb{E}[(v_t^{(i)})_2] &= \mathbb{E}[(v_t^{(i)})^2] - \mathbb{E}[v_t^{(i)}] \\
&= \lfloor Nw_t^{(i)} \rfloor^2 + 2\lfloor Nw_t^{(i)} \rfloor r_i + r_i\left(1 - \frac{r_i}{N-k} + r_i\right) - Nw_t^{(i)} \\
&= \lfloor Nw_t^{(i)} \rfloor^2 - \lfloor Nw_t^{(i)} \rfloor + 2\lfloor Nw_t^{(i)} \rfloor r_i + r_i^2\left(1 - \frac{1}{N-k}\right) \\
&= (Nw_t^{(i)})^2 - \lfloor Nw_t^{(i)} \rfloor - \frac{r_i^2}{N-k}
\end{aligned}
$$

so we get

$$
\begin{aligned}
\mathbb{E}[c_N^r(t)|\mathcal{F}_{t-1}] &= \frac{1}{(N)_2}\mathbb{E}\left[\sum_{i=1}^N \mathbb{E}[(v_t^{(i)})_2]|\mathcal{F}_{t-1}\right] \\
&= \frac{N}{N-1}\sum_{i=1}^N \mathbb{E}[(w_t^{(i)})^2|\mathcal{F}_{t-1}] - \frac{1}{(N)_2}\sum_{i=1}^N \mathbb{E}\left[\frac{r_i^2}{N-k}|\mathcal{F}_{t-1}\right] - \frac{1}{(N)_2}\mathbb{E}[k|\mathcal{F}_{t-1}] \\
&= \mathbb{E}[c_N^m(t)|\mathcal{F}_{t-1}]\left(1 + \frac{1}{N-1}\right) - \frac{1}{(N)_2}\mathbb{E}\left[\frac{\sum_{i=1}^N (Nw_t^{(i)} - \lfloor Nw_t^{(i)} \rfloor)^2}{\sum_{j=1}^N (Nw_t^{(j)} - \lfloor Nw_t^{(j)} \rfloor)}|\mathcal{F}_{t-1}\right] \\
&\quad - \frac{1}{(N)_2}\mathbb{E}\left[\sum_{i=1}^N \lfloor Nw_t^{(i)} \rfloor|\mathcal{F}_{t-1}\right]
\end{aligned}
$$

Sanity check:
When the weights are all equal, $w_t^{(i)} \equiv 1/N$, we should have $\mathbb{E}[c_N^r(t)|\mathcal{F}_{t-1}] = 0$ since each particle will have exactly one offspring so it is impossible for any lineages to coalesce. In this case we have $\mathbb{E}[c_N^m(t)|\mathcal{F}_{t-1}] =$

$\sum_{i=1}^{N} \mathbb{E}[(w_t^{(i)})^2|\mathcal{F}_{t-1}] = 1/N$ for multinomial resampling. We also have that $Nw_t^{(i)} \equiv \lfloor Nw_t^{(i)} \rfloor \equiv 1$ and hence $r_i = 0$ and $k = N$. Thus the RHS comes out as

$$\frac{1}{N}\frac{N}{N-1} - 0 - \frac{1}{(N)_2}N = \frac{1}{N-1} - \frac{1}{N-1} = 0$$

as expected.

2 Squared coalescence rate and other awful expressions

First let's write down various moments that will be needed (where $i \neq j$).

$$\mathbb{E}[(v_t^{(i)})^2|\mathcal{F}_{t-1}] = \lfloor Nw_t^{(i)} \rfloor^2 + 2\lfloor Nw_t^{(i)} \rfloor Nw_t^{(i)} + (N)_2(w_t^{(i)})^2$$

$$\mathbb{E}[(v_t^{(i)})^3|\mathcal{F}_{t-1}] = \lfloor Nw_t^{(i)} \rfloor^3 + 3\lfloor Nw_t^{(i)} \rfloor^2 Nw_t^{(i)} + 3\lfloor Nw_t^{(i)} \rfloor(N)_2(w_t^{(i)})^2 + (N)_3(w_t^{(i)})^3$$

$$\mathbb{E}[(v_t^{(i)})^4|\mathcal{F}_{t-1}] = \lfloor Nw_t^{(i)} \rfloor^4 + 4\lfloor Nw_t^{(i)} \rfloor^3 Nw_t^{(i)} + 6\lfloor Nw_t^{(i)} \rfloor^2(N)_2(w_t^{(i)})^2 + 4\lfloor Nw_t^{(i)} \rfloor(N)_3(w_t^{(i)})^3 + (N)_4(w_t^{(i)})^4$$

$$\mathbb{E}[v_t^{(i)}v_t^{(j)}|\mathcal{F}_{t-1}] = \lfloor Nw_t^{(i)} \rfloor\lfloor Nw_t^{(j)} \rfloor + \lfloor Nw_t^{(i)} \rfloor Nw_t^{(j)} + \lfloor Nw_t^{(j)} \rfloor Nw_t^{(i)} + (N)_2 w_t^{(i)}w_t^{(j)}$$

$$\mathbb{E}[(v_t^{(i)})^2 v_t^{(j)}|\mathcal{F}_{t-1}] = \lfloor Nw_t^{(i)} \rfloor^2\lfloor Nw_t^{(j)} \rfloor + \lfloor Nw_t^{(i)} \rfloor^2 Nw_t^{(j)} + 2\lfloor Nw_t^{(i)} \rfloor\lfloor Nw_t^{(j)} \rfloor Nw_t^{(i)} + 2\lfloor Nw_t^{(i)} \rfloor(N)_2 w_t^{(i)}w_t^{(j)}$$
$$+ \lfloor Nw_t^{(j)} \rfloor(N)_2(w_t^{(i)})^2 + (N)_3(w_t^{(i)})^2 w_t^{(j)}$$

$$\mathbb{E}[(v_t^{(i)})^2(v_t^{(j)})^2|\mathcal{F}_{t-1}] = \lfloor Nw_t^{(i)} \rfloor^2\lfloor Nw_t^{(j)} \rfloor^2 + 2\lfloor Nw_t^{(i)} \rfloor^2\lfloor Nw_t^{(j)} \rfloor Nw_t^{(j)} + 2\lfloor Nw_t^{(i)} \rfloor\lfloor Nw_t^{(j)} \rfloor^2 Nw_t^{(i)}$$
$$+ \lfloor Nw_t^{(i)} \rfloor^2(N)_2(w_t^{(j)})^2 + 4\lfloor Nw_t^{(i)} \rfloor\lfloor Nw_t^{(j)} \rfloor(N)_2 w_t^{(i)}w_t^{(j)} + \lfloor Nw_t^{(j)} \rfloor^2(N)_2(w_t^{(i)})^2$$
$$+ 2\lfloor Nw_t^{(i)} \rfloor(N)_3 w_t^{(i)}(w_t^{(j)})^2 + 2\lfloor Nw_t^{(j)} \rfloor(N)_3(w_t^{(i)})^2 w_t^{(j)} + (N)_4(w_t^{(i)})^2(w_t^{(j)})^2$$

For the squared coalescence rate, expanding the falling factorials appropriately, we get

$$\mathbb{E}[(c_N^r(t))^2|\mathcal{F}_{t-1}] = \frac{1}{(N)_2^2}\left(\sum_{i=1}^{N}\mathbb{E}[(v_t^{(i)})_2^2|\mathcal{F}_{t-1}] + \sum_{i=1}^{N}\sum_{j\neq i}\mathbb{E}[(v_t^{(i)})_2(v_t^{(j)})_2|\mathcal{F}_{t-1}]\right)$$

$$= \frac{1}{(N)_2^2}\sum_{i=1}^{N}\left(\mathbb{E}[(v_t^{(i)})^4|\mathcal{F}_{t-1}] - 2\mathbb{E}[(v_t^{(i)})^3|\mathcal{F}_{t-1}] + \mathbb{E}[(v_t^{(i)})^2|\mathcal{F}_{t-1}]\right)$$

$$+ \frac{1}{(N)_2^2}\sum_{i=1}^{N}\sum_{j\neq i}\left(\mathbb{E}[(v_t^{(i)})^2(v_t^{(j)})^2|\mathcal{F}_{t-1}] - \mathbb{E}[(v_t^{(i)})^2 v_t^{(j)}|\mathcal{F}_{t-1}] - \mathbb{E}[v_t^{(i)}(v_t^{(j)})^2|\mathcal{F}_{t-1}] + \mathbb{E}[v_t^{(i)}v_t^{(j)}|\mathcal{F}_{t-1}]\right)$$

Then we can try plugging in the expressions derived above and find that none of the terms cancel. Maybe if we're clever we can factorise it or something.

3 Mega-merger rate

Now the rate of super0binary mergers...

$$\mathbb{E}[D_N(t)|\mathcal{F}_{t-1}] = \frac{1}{N(N)_2}\sum_{i=1}^{N}\left(\mathbb{E}[(v_t^{(i)})^3|\mathcal{F}_{t-1}] - \mathbb{E}[(v_t^{(i)})^2|\mathcal{F}_{t-1}]\right)$$

$$+ \frac{1}{N(N)_2}\sum_{i=1}^{N}\sum_{j\neq i}\left(\mathbb{E}[(v_t^{(i)})^2(v_t^{(j)})^2|\mathcal{F}_{t-1}] - \mathbb{E}[v_t^{(i)}(v_t^{(j)})^2|\mathcal{F}_{t-1}]\right)$$
